THE LAYERS OF LAMINATE

Laminate is constructed in layers to create lasting, affordable, beautiful floors. Four layers of material, each of which has its own purpose, are fused together through a direct-pressure process that binds them into one extremely durable material. And this material is today's laminate—a type of flooring that will endure much wear and tear, performing well for many years.

A CLOSER LOOK AT LAMINATE LAYERS:

- **Layer 1:** A melamine backing layer that provides a moisture barrier and structural integrity and stability.
- **Layer 2:** A dense, strong inner layer—HDF—made of compressed wood fiber.
- **Layer 3:** A melamine decorative layer that provides the floor's beauty and realism through highly detailed photography—giving laminate the appearance of natural hardwood.
- **Layer 4:** Highly anti abrasive protective overlay that offers a tough, beautiful finish resistant to stain, fade, and wear.

HDF - Thickness 8 mm AC4 | 1218 X 198 X 8 mm
8 PLANKS/PACK | 1.929 Sqm. = 20.76 Sqft.
